

Hotel Operational Excellence & Profitability Case Study

Independent portfolio case study | Synthetic data | Formula-driven Excel model

Objective Demonstrate a structured approach to hotel profitability analysis, operational improvement and benefits governance without using employer or Mandarin Oriental data.

Diagnostic snapshot

Revenue vs Budget	GOP vs Budget	GOP Margin	Guest Satisfaction
HK\$(60k)	HK\$(1.50m)	33.3% vs 38.6%	88 (guardrail 88)

Approach

1. Diagnose Integrated P&L variance; rooms PVM bridge; labour hours/rate decomposition; F&B cost-rate review.	2. Test Base / Moderate / Stretch scenarios; occupancy, ADR, labour and cost-driver levers; service guardrails.	3. Govern ROI / NPV and sensitivity; Finance validation; baseline, attribution and double-count controls; benefits tracker.
---	---	---

Executive conclusion

Near-budget revenue was not converting to planned GOP. The model isolated labour and F&B as priority cost drivers and recommended a controlled Moderate pilot, with Finance validation and a guest-satisfaction stop/redesign guardrail.

What this demonstrates

- Financial and operational performance analysis: Budget / Actual / Forecast, variance, profitability and cost drivers.
- Operational excellence: structured problem solving, scenario design, labour analysis and improvement governance.
- Decision support: converting analysis into a concise recommendation with ownership, validation and service safeguards.

Note: All data and assumptions are synthetic and were created solely for professional development and portfolio demonstration. No employer, hotel or Mandarin Oriental data is used.
